

# The **ViralURL** System

## How to use the ViralURL Advanced Cloaking Section:

Video version of this tutorial at: <http://ViralURL.com/video-advancedcloaking.php>

Welcome to the ViralURL Advanced Cloaking Section Tutorial.

In this tutorial you will learn how the Advanced Cloaking Section works.

**Please Note:** After watching the video and also reading this, if you are still unable to understand how the advanced cloak works, please continue to use 'regular cloaking' as it performs the same function, and we do **not** offer technical support for this feature.

On the following screenshot you can see the Cloaking Section → Advance Cloaking Section.

## Cloaking Section → Advance Cloaking Section

RedirectMatch permanent ^/loves/(.\*)\$ /viralurl.php?kw=\$1

Copy To Clipboard

**The Result:**  
Instead of using... <http://ViralURL.com/mine/Keyword>  
You can now use... <http://YourDomain.com/mine/Keyword>

**Quick Tip:**  
Instead of using <http://YourDomain.com/mine/Keyword> you can use any other word you like instead of mine like e.g. recommends, likes, presents etc.  
Just replace mine in the step #2 code with the word of your choice and make sure that there is no directory with that name.

Here is the code you need:

**Step #1:** Copy this code in a file called: viralurl.php  
Then upload the file into your web servers htdocs, public\_html or www directory.

```
<?php header("Location: http://ViralURL.com/Suraj/${_GET[kw]}"); ?>
```

Copy To Clipboard

**Step #2:** Add this code as the first line to your existing .htaccess file in your web servers htdocs, public\_html or www directory.  
If there is no .htaccess file, copy this code into a file called .htaccess and upload the file into your web servers htdocs, public\_html or www directory. Make sure the last line of the .htaccess file is blank.

```
RedirectMatch permanent ^/Suraj/(.*)$ /viralurl.php?kw=$1
```

Copy To Clipboard

This section is used to show you how to cloak your affiliate links using your own domain name.

## The **ViralURL** System

In this section you have to use FTP. If you don't know about this then you might want to consider buying a book on FTP or to outsource this task to somebody that you can hire for a few dollars at <http://www.RentaCoder.com>.

Basically FTP (File Transfer Protocol) is used to upload or download files from your web server.

In step #1 you have to copy the given code. Open the MS Notepad application on your PC (or any other plain text editor) and paste this code into it. Then save the file with name of viralurl.php and change save file as type to "All files".

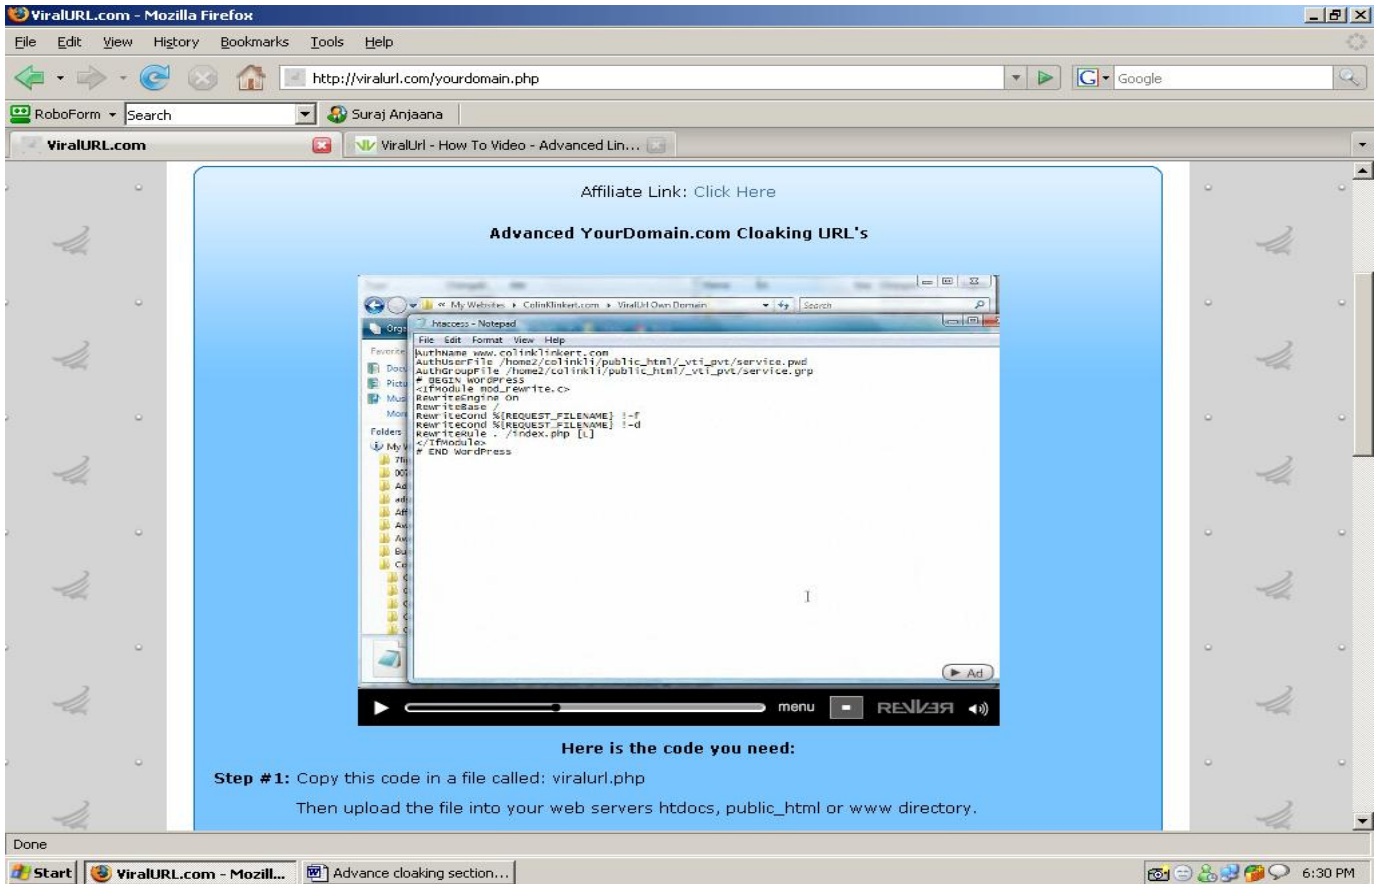

Now you have to follow the second step. In the second step you have to copy again a given code and add it to your .htaccess file.

You can find your .htaccess file in your web root directory (public\_html, htdocs or www). Download it and paste this code on top above the file contents. Save and upload **both files** (through FTP) in ASCII mode.

**Note:** The "Surjay" word in the "RedirectMatch permanent ^/Suraj/(.\*)\$ /viralurl.php?kw=\$1" code can be changed to your requirement but keep in mind that it should not conflict with any existing directory. You can put here any keyword according to your choice. (e.g. suggests, likes, recommends, loves, etc.)

Your .htaccess file should look like the picture on the next page and you have to place the above code on the top above existing line of this file...

**Advanced YourDomain.com Cloaking URL's**

```
AuthName www.colink1tort.com
AuthUserFile /home2/colink1/public_html/_vti_pvt/service.pwd
AuthGroupFile /home2/colink1/public_html/_vti_pvt/service.grp
# BEGIN wordpress
<!--Module mod_rewrite.c-->
RewriteEngine On
RewriteBase /
RewriteCond %{REQUEST_FILENAME} !-f
RewriteCond %{REQUEST_FILENAME} !-d
RewriteRule ^.*$ /index.php [L]
# END wordpress
```

Here is the code you need:

**Step #1:** Copy this code in a file called: viralurl.php  
Then upload the file into your web servers htdocs, public\_html or www directory.

Done

Start ViralURL.com - Mozill... Advance cloaking section... 6:30 PM

After uploading the .htaccess and PHP file, come back to the Cloaking Section and go to the Cloaking Section → Current Url's Section and copy a URL from current URL's group like picture on the next page...

# The ViralURL System

## Cloaking Section → Current Url

Keyword	Short URL -->	Target URL	Action
BFM	http://viralurl.com/Suraj/BFM -->	http://tmstore.bfmscript.hop.clickbank.net	Copy Stats Edit Delete 2
Blog2	http://viralurl.com/Suraj/Blog2 -->	http://viralurl.com/Suraj	Copy Stats Edit Delete 5
Banner	http://viralurl.com/Suraj/Banner -->	http://viralurl.com/Suraj	Copy Stats Edit Delete 6
Blog1	http://viralurl.com/Suraj/Blog1 -->	http://ViralURL.com/Suraj	Copy Stats Edit Delete 5
Blog	http://viralurl.com/Suraj/Blog -->	http://viralurl.com/Suraj	Copy Stats Edit Delete 0
Forum	http://viralurl.com/Suraj/Forum -->	http://viralurl.com/Suraj	Copy Stats Edit Delete 0
*AffiliateLink	http://viralurl.com/Suraj/*AffiliateLink -->	http://ViralURL.com/Suraj/*AffiliateLink	Copy Stats Edit Delete 7

As shown in the above picture, copy the link location and paste them in a MS Notepad file for editing this URL. Here we copy the URL: <http://viralurl.com/Suraj/Blog> Now we can write in the place of viralurl **the domain we uploaded the files to** and we can change the part that says Suraj also as we discussed before.

Here is an example of what the advanced cloaked link can look like:  
<http://surajseoservices.com/likes/Blog>

**Note:** This is a pure example only, the above link doesn't work!
